

NAME

netarchive – manage archival copies of network backups

SYNOPSIS

netarchive [*options*] backup–host

DESCRIPTION

netarchive makes archival copies of backups on a remote server using **rsync**(1). Old backups are progressively thinned as they age.

All snapshots are retained for 24 hours. Thereafter, a daily is retained for a month, a weekly for a quarter, monthly for a year, and quarterly indefinitely.

OPTIONS

-a, --all

Make snapshots of all backups present on server.

-r, --recycle=*count*

Number of expired snapshots retained for recycling. Recycled snapshots are reused in the future, incurring only deltas to refresh and avoiding unnecessary unlinks/relinks.

-p, --purge

Purge only; do not make new snapshots.

-v, --verbose

Verbose output.

-n, --no-removal

Suppress removal of files. Used with **-v**, this shows what would be removed without actual removal.

EXIT STATUS

0 on success, non-0 on error.
